

Henry Boot Developments Environmental Policy

Henry Boot Developments undertakes a diverse range of development and regeneration projects throughout the U.K. The same rigorous environmental standards are applied to each development project regardless of size: -

- Each forthcoming development project is the subject of a full environmental assessment to identify potential issues and opportunities.
- From the outset environmental issues are addressed as an integral part of all design development, with an emphasis on maximising sustainability and minimising environmental impact.
- In addition to nationally recognised standards, particular attention is paid to locally derived environmental and sustainability issues, with the aim of fully accounting for these at the principal design stage.
- Throughout the development process emphasis is placed on minimising resource use and environmental impact. This is achieved by maximising the reuse of on site materials, protecting sensitive onsite / adjacent structures, adopting sustainable work practices and protecting wildlife habitat.

Through the adoption of these principles it is the aim of Henry Boot Developments not only to deliver high quality sustainable developments but also an environment, which will have a positive impact on the surrounding community, respect local / national heritage and allow sustainable use for many years to come.
